Matagorda's modernization is scheduled to take nine months; however, work on future cutters is anticipated to be completed in just six months. She will have her length extended 13 feet to accommodate the addition of a stern boat-launch ramp, among other improvements. Also planned for the modernization effort are extensive crew quarters improvements, berthing reconfiguration, galley upgrades, new equipment installation and state-of-the-art capabilities enhancements in communications, detection, and prosecution. In the future, there will be up to five cutters under construction at a time, returning a 123-ft. cutter every six weeks.

“Though decommissioned, temporarily, as the necessary work is done to refit her, the cutter Matagorda will not be idle,” Admiral Collins acknowledged. “She will be leading the way for the Coast Guard to enter a new era.”
What’s New With Deepwater?

Congratulations to all on significant accomplishments since last summer’s contract award!

- Opened and staffed program offices in Avondale, La.; Moorestown, N.J.; and Rosslyn, Va.
- Completed Post Award System Evaluation
- Awarded 15 delivery orders
- Groundbreaking for state-of-the-art Development, Integration, & Test Center

Patrol Boats Provide Winning Solution

When USCGC Matagorda (WPB-1303) and her sister Island Class patrol boats return to the fleet after Deepwater modernization, they will have vastly improved habitability, 13 more feet of length, a stern boat-launch, improved C4ISR systems, and a full 360-degree visibility from the bridge. Strong emphasis was placed on integrating the logistics systems throughout the design and construction, including the new berthing design that allows for unrestricted dual-gender assignments.

“The Coast Guard gave us a very difficult set of constraints for our Integrated Deepwater System (IDS),” explained Integrated Coast Guard Systems President Paul Ecker. “It had to be built with the twin lighthouses of maximum operational effectiveness and lowest possible total ownership cost. We wanted to give Coast Guard men and women some better tools soon and we determined a single generation of patrol boats would not last the entire 40-year life of the IDS. Modernizing the Island Class and replacing them downstream was our solution and it was a winner,” he recounted proudly.

T.R. Hamblin, Vice President of Government Programs at Bollinger Shipyards, Lockport, La., was involved with the acquisition of the 110-ft. Island Class before he retired from the Coast Guard.

“I’ve never seen a Coast Guard patrol boat I didn’t like,” he quipped, “but this new one is really going to be great! It will have so much C4ISR capability; at times I see it as 123 feet of electronics! Sailors in the fleet are going to love it,” Hamblin promised.

A Rich Legacy

Moviegoers will recall the thrilling opening scene from Tom Clancy’s “Clear and Present Danger,” where a majestic high-speed Coast Guard vessel overtook the evildoers. That vessel was an Island Class patrol boat, the same as those used every day by the Coast Guard to save lives, enforce laws and treaties, protect our homeland and all of our marine resources.

However, over the years, a number of problems emerged with these venerable vessels. Their design and technologies had grown out-of-date. Telecommunication, sensors, and many other systems needed updating. Launching and recovering the small boat – especially in rough weather – was a dangerous evolution that required far too many crewmembers.

Patrol boats have a rich legacy dating to the days when they ran down rumrunners. During World War II, 83-ft. wooden patrol boats were sent to the English Channel, where they rescued downed pilots and others who encountered danger on the waters.

A new fleet of 95-ft. boats entered the service in the 1950s to patrol near shore during the height of the Cold War. In the 1960s, another new class of 82-ft. boats were sent to Vietnam for drug interdiction operations. Ultimately, all of these boats were transferred to the government of South Vietnam.

In 1978, Coast Guard Commandant, Admiral John Hayes, issued a revolutionary order that, henceforth, assignment of Coast Guard women would be unrestricted so long as adequate hygiene facilities were available. Previously, such facilities had been available to officers only (many women had commanded Coast Guard boats); however, the Commandant’s order enabled women crewmembers to serve on the boats, as well.

In the 1980s and 90s, increasing demands for anti-drug efforts led to another fleet of Coast Guard patrol boats. Bollinger Shipyards built 49 of these Island Class boats, using a “Parent Craft” design, which were quickly pressed into service. Subsequently, Bollinger provided the 87-ft. fleet and, when this program is completed, will have provided the Coast Guard’s entire present patrol boat inventory.
New Test Center to Open in ’03

MOORESTOWN, N.J. – A $9.4 million, 46,000 sq. ft. facility will open in the fall of 2003 to collocate Lockheed Martin and partner Northrop Grumman, enabling more efficient systems integration and cost-effective C4ISR development.

Lockheed Martin broke ground for the Center last December. U.S. Coast Guard Rear Adm. Patrick M. Stillman said at the groundbreaking ceremony, “Worry not; the public trust is in good hands with this partnership and we will not let the American people down.”

The Development, Integration, & Test Center will be dedicated to the Deepwater Program for Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance, or C4ISR. Some 16,000 sq. ft. of laboratory space will be housed in the Center, which is being built near Lockheed Martin’s Theater Network Integration and Naval Systems Computing Centers.

Naval Electronics & Surveillance Systems President Fred Moosally indicated the synergies created among these centers will provide Lockheed Martin and its customers with an unmatched capability to conduct surface systems integration, testing, and interoperability efforts across the full range of systems.

The Integrated Coast Guard Systems Deepwater Program is the largest modernization program in the U.S. Coast Guard’s history and is the first layer of defense in the Homeland Security defense effort.

Open Business Model Promotes ‘Best Practices’

The Open Business Model, or OBM\textsuperscript{SM}, was developed to establish a model to match mission demand with operational capabilities and to serve as a framework, or process, to promote competitiveness and “best practices” among team members and suppliers.

OBM\textsuperscript{SM} was created to institute flexibility to identify supplier networks, as well as provide a channel to invite new technologies – or better, more fully developed, newer, more innovative products – at the time of major system award. Although most base period suppliers enjoy “preferred” status, suppliers will be reevaluated upon changed requirements or circumstances. OBM\textsuperscript{SM} does not mean there has been or will be program-wide recompetition of all current baseline solutions after award.

OBM\textsuperscript{SM} is employed at various stages of system review, asset study, and selection. As applied throughout Phase 1 of the Deepwater Program, the incorporation of four years of market research, trade studies, customer input, and open competitions has resulted in the current baseline. System framework for out-year major systems competed in the Deepwater proposal, such as VTOL Recovery and Surveillance Aircraft, provides opportunities, should program requirements change. The absence of percentage-based teaming agreements under OBM\textsuperscript{SM} allows flexibility.

OBM\textsuperscript{SM} is executed by a variety of methods, such as trade studies, Industry Day (see photo), market survey, site visit, request-for-information, or request-for-proposal. Efforts that have benefited under the OBM\textsuperscript{SM} model include the Vertical Take-Off and Landing Unmanned Air Vehicle and the Maritime Patrol Aircraft.

First Supplier Industry Day Successful

Each year, those systems or products which have registered and may have application to the Deepwater program will be invited to participate in that year’s supplier Industry Day. (See Box.) Visit our website to register: www.integratedcoastguardsystems.com/registration_subcontract_opps.html

First Industry Day Results, Oct. 1-3, 2002

Registration Results
- Total Registrations: 613
- Individual Companies: 405

Interview Statistics
- Total: 251
- Individual Companies: 181
- Small Businesses: 102
- International: 25

Several Promising Innovations Identified
- Over 40 new suppliers under consideration
- Over 19 new suppliers referred to lower tier subcontractors or other programs
Veterans Add Diversity To Deepwater

BETHESDA, Md. – Veteran-owned businesses have formed a consortium to pool their resources and leverage their expertise for the success of the Coast Guard Deepwater Program. Catapult Technology, Ltd., Bethesda, was selected to lead the consortium. Catapult is the portal into the best that the veteran community has to offer, functioning both as a subcontractor to Integrated Coast Guard Systems (ICGS) and as the prime integrator for the Veteran’s Consortium as it responds to specific Deepwater program requirements.

Veteran-owned businesses provide a loud, supportive, and credible voice throughout the federal government on Homeland Security and Defense, and particularly for Deepwater. The Veteran’s Consortium has extensive experience with USCG and DOD C4ISR. Many of the firms utilize retired U.S. Coast Guard personnel on staff or as business owners. ICGS recognizes the Consortium as a valuable resource in meeting its commitments to the Coast Guard and the small-business community, including ICGS disadvantaged, Veteran and Service Disabled Veteran contracting goals. Their presence on Capitol Hill is an important element in keeping Deepwater viable in the years ahead.

The Veteran’s Entrepreneurship and Small Business Development Act of 1999 provided for the Government-chartered Veteran’s Task Force, and a not-less-than three percent small business contracting/subcontracting goal for federal contracting. Subsequently, the National Veteran’s Business Development Corporation was chartered and funded by Congress to be an advocate to the Veteran and Disabled Veteran business community. The Secretaries of Defense and Veteran’s Affairs sit on its Board of Directors. Members of the Veteran’s Task Force are appointed by the President of the United States and have representation from our nation’s veterans’ organizations.
